Arkwright Expands Media Line for Solvent-Based Inkjet Printers

April 1, 2008 – Fiskeville, RI – Arkwright, a worldwide leader in developing, coating, converting, and marketing digital imaging media announces the addition of three new media designed for use with solvent, and UV curable inkjet printers.

Solvent Photo Satin Paper (277.60) – This new product has a bright white, solvent-compatible inkjet receiver coating that features a smooth, solvent ink receptive surface. It is designed to produce photo-quality images on solvent printers with improved color gradients and image uniformity. 277.60 is a superior choice for high-resolution photographic indoor applications intended for up-close viewing. 277.60 is compatible with most solvent inkjet printers and inks, and produces a vibrant luster image when printed on UV curable inkjet printers including the Durst UV, HP Colorspan, and Mimaki JF Series. ([link to spec sheet](#))

Solvent Gloss Paper (737.21) – This media is an economic alternative to glossy paper. With a uniform, treated gloss surface and a hefty 190 grams per square meter (gsm) basis weight, 737.21 “photorealistic” paper will outperform the printed image quality of most uncoated competitive papers. It is designed for signage and display applications where an economic paper product is desired, but high performance is still essential. ([link to spec sheet](#))

Solvent Fast Dry Matte Backlit Film (566.50) – This polyester-based film is designed to dry fast, enabling users to take advantage of automated take up systems on their printers for high production print jobs, while still providing the maximum image density required for a backlit application. With 566.50, high image density can be achieved in one-pass printing instead of two or more as required for some competitive films, resulting in a substantial ink cost savings.
